

## **Editorial**

We now publish the second issue of the fourteenth volume of the International Journal of Web Applications.

In the opening paper on “**The content management system of the CADCOM platform**”, the authors studied the responsive web design layout with the online CADCOM platform. The authors have used the software development and a good web design layout to do it. Besides, they have developed the content management system of the CADCOM platform

In the next paper on “**Isomorphism of hypergraphs at an efficient clustering model**”, the authors have studied the link and connectivity issues in wireless sensor networks. They have used an isomorphism of a particularly hypergraph to arrive at an efficient clustering model. Moreover, the work further calculated the chromatic polynomial and created a chordal graph way.

In the last paper on “**Third-order intercept point of intermodulation products**”, the authors estimated the impact of receiver’s nonlinearity on the performance of telecommunication systems. They have also studied the issues of interference created by intermodulation products which get unrelated interference signals at receivers. With the help of the third-order input intercept point, the authors have proved the specification of GSM receiver.

We hope that the research in this issue can generate more interest for further research.
