

Editorial

We now release the second issue of the twelfth volume of the Information Security Research.

In the opening paper on **“VANET-based Protocols for Intelligent Transport Systems”**, the authors to use the Intelligent Transport Systems effectively, have deployed various VANET based protocols. In this paper they further have introduced the protocols that can sense the adverse weather conditions.

In the second paper on **“The Outage Capacity Evaluation of Wireless Communication Channel”**, the authors have presented the outage capacity evaluation of wireless communication channel. The authors have completed the experimentation and presented the derived analytical expressions, which shown and influence of various performance parameters on outage capacity.

In the last paper on **“A study of the Exponential Functions, Combinatorial Problems and the Generalizations Issues”** the authorshave discussed the continued fractions, the moments of the functions and generalizations of the exponential function. These discussions form an important of information security issues.

We do hope that the published papers contain technical enhancements which will assist further research.
